### On Schemes for Exponential Decay

#### Hans Petter Langtangen<sup>1,2</sup>

Center for Biomedical Computing, Simula Research Laboratory  $^1$  Department of Informatics, University of Oslo $^2$ 

Jul 8, 2020

#### Goal

The primary goal of this demo talk is to demonstrate how to write talks with DocOnce and get them rendered in numerous HTML formats.

#### Layout

This version utilizes beamer slides with the theme red\_plain.

Problem setting and methods

Results

# Problem setting and methods

# We aim to solve the (almost) simplest possible differential equation problem

$$u'(t) = -au(t) \tag{1}$$

$$u(0) = I \tag{2}$$

Here,

- $ightharpoonup t \in (0, T]$
- ▶ a, I, and T are prescribed parameters
- $\triangleright$  u(t) is the unknown function
- ► The ODE (1) has the initial condition (2)

- Mesh in time:  $0 = t_0 < t_1 \cdots < t_N = T$
- Assume constant  $\Delta t = t_n t_{n-1}$
- $\triangleright$   $u^n$ : numerical approx to the exact solution at  $t_n$

The  $\theta$  rule,

$$u^{n+1} = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler ( $\theta=0$ ), the Backward Euler ( $\theta=1$ ), and the Crank-Nicolson ( $\theta=0.5$ ) schemes.

- ► Mesh in time:  $0 = t_0 < t_1 \cdots < t_N = T$
- Assume constant  $\Delta t = t_n t_{n-1}$
- $ightharpoonup u^n$ : numerical approx to the exact solution at  $t_n$

The  $\theta$  rule,

$$u^{n+1} = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler ( $\theta=0$ ), the Backward Euler ( $\theta=1$ ), and the Crank-Nicolson ( $\theta=0.5$ ) schemes.

- ► Mesh in time:  $0 = t_0 < t_1 \cdots < t_N = T$

- $\triangleright$   $u^n$ : numerical approx to the exact solution at  $t_n$

The  $\theta$  rule,

$$u^{n+1} = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler (heta=0), the Backward Euler (heta=1), and the Crank-Nicolson (heta=0.5) schemes.

- ► Mesh in time:  $0 = t_0 < t_1 \cdots < t_N = T$
- Assume constant  $\Delta t = t_n t_{n-1}$
- $\triangleright$   $u^n$ : numerical approx to the exact solution at  $t_n$

The  $\theta$  rule,

$$u^{n+1} = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler ( $\theta=0$ ), the Backward Euler ( $\theta=1$ ), and the Crank-Nicolson ( $\theta=0.5$ ) schemes.

- ► Mesh in time:  $0 = t_0 < t_1 \cdots < t_N = T$
- Assume constant  $\Delta t = t_n t_{n-1}$
- $\triangleright$   $u^n$ : numerical approx to the exact solution at  $t_n$

The  $\theta$  rule,

$$u^{n+1} = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}u^n, \quad n = 0, 1, \dots, N - 1$$

contains the Forward Euler ( $\theta=0$ ), the Backward Euler ( $\theta=1$ ), and the Crank-Nicolson ( $\theta=0.5$ ) schemes.

### The Forward Euler scheme explained

http://youtube.com/PtJrPEIHNJw

### **Implementation**

```
Implementation in a Python function:
def solver(I, a, T, dt, theta):
     """Solve u'=-a*u, u(0)=I, for t in (0,T]; step: dt."""
    dt = float(dt)  # avoid integer division
    N = int(round(old_div(T,dt)))  # no of time intervals
    T = N*dt
                      # adjust T to fit time step dt
    u = zeros(N+1)  # array of u[n] values
    t = linspace(0, T, N+1) # time mesh
    \mathbf{u}[0] = \mathbf{I}
                        # assign initial condition
    for n in range(0, N): # n=0,1,...,N-1
        u[n+1] = (1 - (1-theta)*a*dt)/(1 + theta*dt*a)*u[n]
    return u, t
```

### How to use the solver function

# A complete main program # Set problem parameters T = 1.2a = 0.2T = 8dt = 0.25theta = 0.5|\pause| from solver import solver, exact\_solution u, t = solver(I, a, T, dt, theta) |\pause| import matplotlib.pyplot as plt plt.plot(t, u, t, exact\_solution) plt.legend(['numerical', 'exact']) plt.show()

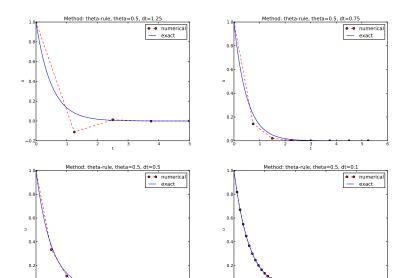

Problem setting and methods

#### Results

# Results

The Crank-Nicolson method shows oscillatory behavior for not sufficiently small time steps, while the solution should be monotone

Exact solution of the scheme

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

#### Key results:

- ► Stability: |A| < 1
- ightharpoonup No oscillations: A > 0
- $ightharpoonup \Delta t < 1/a$  for Forward Euler (heta = 0)
- $ightharpoonup \Delta t < 2/a$  for Crank-Nicolson ( heta = 1/2)

#### Concluding remarks:

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

#### Key results:

- Stability: |A| < 1
- ightharpoonup No oscillations: A > 0
- $ightharpoonup \Delta t < 1/a$  for Forward Euler  $(\theta = 0)$
- $ightharpoonup \Delta t < 2/a$  for Crank-Nicolson ( $\theta = 1/2$ )

#### Concluding remarks

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

#### Key results:

- ► Stability: |*A*| < 1
- No oscillations: A > 0
- $ightharpoonup \Delta t < 1/a$  for Forward Euler ( $\theta = 0$ )
- $ightharpoonup \Delta t < 2/a$  for Crank-Nicolson ( heta = 1/2)

#### Concluding remarks

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

Key results:

▶ Stability: |A| < 1

► No oscillations: *A* > 0

 $ightharpoonup \Delta t < 1/a$  for Forward Euler ( $\theta = 0$ )

lacksquare  $\Delta t < 2/a$  for Crank-Nicolson ( heta=1/2)

#### Concluding remarks:

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

Key results:

- ► Stability: |*A*| < 1
- ► No oscillations: *A* > 0
- $ightharpoonup \Delta t < 1/a$  for Forward Euler ( $\theta = 0$ )
- $\Delta t < 2/a$  for Crank-Nicolson  $(\theta = 1/2)$

#### Concluding remarks:

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

Key results:

- ► Stability: |*A*| < 1
- ► No oscillations: *A* > 0
- ▶  $\Delta t < 1/a$  for Forward Euler ( $\theta = 0$ )
- ▶  $\Delta t < 2/a$  for Crank-Nicolson ( $\theta = 1/2$ )

#### Concluding remarks:

Exact solution of the scheme:

$$u^n = A^n$$
,  $A = \frac{1 - (1 - \theta)a\Delta t}{1 + \theta a\Delta t}$ .

Key results:

- **▶** Stability: |*A*| < 1
- ► No oscillations: *A* > 0
- ▶  $\Delta t < 1/a$  for Forward Euler ( $\theta = 0$ )
- ▶  $\Delta t < 2/a$  for Crank-Nicolson ( $\theta = 1/2$ )

#### Concluding remarks:
